This invention relates to a novel composition which comprises at least one protein (or fragment of) encoded by an open reading frame (ORF) of a Neisseria sp. (ORF2086), where the ORF encoding a crossreactive immunogenic antigen provides immunogenicity against infection by Neisseria meningitidis serogroup B in a subject. The composition of the invention may have antibacterial or antiinflammatory activity through the induction of the immune response. The invention may be useful for the treatment of bacterial meningitis in a mammal. One or more polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition comprising crossreactive immunogenic antigen encoded by open reading frame 2086 of Neisseria sp., that provides immunogenicity against meningitis, or its immunogenic portion or biological equivalent.
                                                                                                                                                                                                                                                                                                                      ORF2086; Neisseria meningitidis serogroup B infection; antibacterial; antinflammatory; immune response; bacterial meningitis; Streptococcus pneumoniae infection; non-pathogenic; immunogenic composition; 2086 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Farley J, Bernfield LA,
                                                                                                                                                                                                                                                                                                      Neisseria meningitidis ORF2086 protein SeqID248.
                                                                                                                                                                                                     ALIGNMENTS

(ORF2086), where the ORF encoding a crossracative immunogenic antigen provides immunogenicity against infection by Neisseria meningitidis serogroup B in a subject. The composition of the invention may have antibacterial or antinflammatory activity through the induction of the immune response. The invention may be useful for the treatment of bacterial meningitis in a mammal. One or more polypeptides or nucleic acids encoding such polypeptides are useful in a composition or as a part of the treatment regimen for the prevention of amelioration of Streptococcus pneumoniae infection. The composition of the invention is non-pathogenic and substantially free from any infectious impurities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition comprising crossreactive immunogenic antigen encoded by open reading frame 2086 of Neisseria sp., that provides immunogenicity against meningitis, or its immunogenic portion or biological equivalent.
or nucleic acids encoding such polypeptides are useful in a composition or as a part of the treatment regimen for the prevention of amelioration of Streptococcus pneumoniae infection. The composition of the invention is non-pathogenic and substantially free from any infectious impurities. The immunogenic compositions can be compounded with fewer components to elicit protection compazable to previously used agents. The present sequence is the amino acid sequence of a Neisseria meningitidis strainspecific mature 2086 protein with a native leader sequence which can be used to create the composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ORF2086; Neisseria meningitidis serogroup B infection; antibacterial; antiinflammatory; immune response; bacterial meningitis; Streptococcus pneumoniae infection; non-pathogenic; immunogenic composition; 2086 protein.

This invention relates to a novel composition which comprises at least one protein (or fragment of) encoded by an open reading frame (ORF) of a Neisseria sp. (ORF2086), where the ORF encoding a crossreactive immunogenic antigen provides immunogenicity against infection by Neisseria meningitidis serogroup B in a subject. The composition of the immune response. The invention may bave antibacterial or antiinflammatory activity through the induction of the immune response. The invention may be useful for the treatment of bacterial meningitis in a mammal. One or more polypeptides or nucleic acids encoding such polypeptides are useful in a composition of ras a part of the treatment regimen for the prevention of amelioration of Streptococcus pneumoniae infection. The composition of the invention is non-pathogenic and substantially free from any infectious impurities. The immunogenic compositions can be compounded with fewer components to elicit protection comparable to previously used agents. The present sequence is the amino acid sequence of a Neisseria meningitidis strain-
                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition comprising crossreactive immunogenic antigen encoded by open reading frame 2086 of Neisseria sp., that provides immunogenicity against meningitis, or its immunogenic portion or biological equivalent.
The immunogenic compositions can be compounded with fewer components to elicit profection comparable to previously used agents. The present sequence is the amino acid sequence of a Noisseria meningitidis strainspecific mature 2086 protein which can be used to create the composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibacterial;

The present invention relates to composition (1) comprising at least two multiple variants of meningococcal protein NMB1870 (ADP70202-ADP70246, ADP70280-ADP70280-ADP70286, ADP70280-ADP70280, ADP70280-ADP70280, ADP70280-ADP70280, ADP70280-ADP70280, ADP70280-ADP70280, ADP70280-ADP70280, attribute against each of antipody response which is bactericidal against each of serogroup B Neisseria meningitidis strains MC59, 961-5945 and M1239, and meningitidis strains in at least 2 of hypervirulent lineages ET-37, ET-5, cluster A4, lineage 3, subgroup I, subgroup II, and subgroup IV-1. In NMB1870 is a lipoprotein. In (1) at least one of the proteins does not include the amino acid sequence ADP70271 or ADP70272 within 10 amino acid sequences ADP70271 or ADP70272 within 10 amino acid sequences ADP70273 within 10 amino acid sequences ADP70273 within 10 amino acid sequences ADP70273 within 10 amino acid sequence accordance and accordance and/or mucosal immunity and thereby prevents/treat meningitis and and and accordance accordance accordance accordance a

Caulobacter vibrioides

```
This sequence is encoded by the C. crescentus rsaA gene and represents the paracrystalline S-layer protein. The rsaA gene was used in the production of the heterologous protein of the invention. The heterologous protein is produced by cloning a polypeptide coding sequence, eg. cellulase, xylase or a metallothionein, into a restriction site within the rasA gene which preserves the rsaA reading frame and expressing the twiston sequence in Caulobacter. This S- layer protein bacterial system can be used in bioreactors, eg. to bind toxic metals in sewage waste water etc. or for the treatment of wood pulp suspensions. The system can be used to produce heterologous proteins at the cell surface for use in vaccines, partic. fish vaccines. The S-layer protein is synthesised in large quantities and has a general repetitive sequence, permitting the large amounts of heterologous protein as a fusion product and presentation at the cell surface.                                                                                                                                                                                                                                                                                                                                                                                                                           The Caulobacter crescentus CB15 paracrystalline S-layer protein (AAR17717) is encoded by the reaA gene (AAR17717). It can be used as a fusion partner with polypeptides of interest, allowing presentation of the polypeptide on the surface of the Caulobacter cells. The bacterium is cultured as a biofilm in a bioreactor or may be used to present an artigenic epitope (see ARR94016 and AAR94018) to the environment e.g. for use as a vaccine. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise OS field)

The present sequence represents a Caulobacter S-layer protein used in an example of the present invention. A new DNA construct has been developed which contains at least one restriction site for insertion of DNA upstream of DNA encoding a C-terminal region of at least the last 82 amino acids (aa) of Caulobacter S-layer protein. Caulobacter containing the DNA constructs above additionally containing a sequence encoding a heterologous polypeptide, are particularly useful in live vaccines (where the DNA constructs above additionally containing a sequence encoding a heterologous polypeptide is an antigen). They can also be used for production of e.g. ligands, enzymes or other proteins, e.g. production of e.g. ligands, enzymes or other proteins, e.g. metallothionalist or remove heavy metals from water or sewage, or xylanase or callulase for use in wood pulping All known Caulobacter strains are harmless, and stable in outdoor environments, including water (so suitable for waccinating fish) or soil. They are well suited for growing in biofilm reactors and produce S-layer proteins, which is an ideal system for presentation of antigens, at high level. (Updated on 17-OCT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New DNA containing sequence for C-terminal region of Caulobacter S-layer protein - expressed as fusion proteins containing antigenic peptides in Caulobacter, useful as live vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Surface layer protein; 8-layer secretion signal; antibiotic; vaccine; recombinant fusion protein cleavage; enzyme; protein polymer; antibacterial enzyme; foodstuff.

The present invention relates to Caulobacter deficient in a protease native to Caulobacter that cleaves hybrid Caulobacter S-layer protein monomers. The Caulobacter is useful as a host cell for expression of a hybrid Caulobacter S-layer protein monomer or for the expression of heterologous peptides. The Caulobacter is also useful as an expression system for producing random libraries of peptides or gene fragments for display and panning purposes. This system is useful for the expression of unknown or uncharacterised peptides. The present sequence is Caulobacter crescentus RsaA protein. (Updated on 23-OCT-2001 to standardise OS field)
                                                                                                                                                                                                                                                                                       New Caulobacter deficient in a protease native to Caulobacter that cleaves hybrid Caulobacter S-layer protein monomers, useful as a host cell for expressing a hybrid S-layer protein monomer, or for expressing heterologous peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New HLA-Al, A2, A3, A24, B7 or B44 tumor associated antigen peptides, useful in preparing a composition for diagnosing or treating tumor associated antigen-related disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              epitope; HLA-A1; HLA-A2; HLA-A3; HLA-A24; HLA-B7; HLA-B44; tumour associated antigen peptide; cytostatic; vaccine; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses a method for cleaving a recombinant fusion protein which is produced by Caulobacter and consists of Caulobacter surface layer (S-layer) protein (containing the C-terminal secretion signal) and a target protein heterologous to Caulobacter. The cleavage of target protein heterologous to Caulobacter. The cleavage of target protein heterologous to canditions so that cleavage occurs at aspartate proline dipeptide site without solubilishing the protein. The cleavage is accomplished while the fusion protein is no macoluble aggregate form which facilitates protein in an insoluble aggregate form which facilitates protein in the protein. The method is useful for producing pure protein including recombinant human and animal therapeutic antibiotic and vaccine peptides, enzymes, protein polymers, and antibacterial curymes for foodstuffs. The present sequence is a S-layer protein from C crescentus. The S-layer secretion signal, corresponding to the C-terminal portion of the protein from amino acid 690 onwards, is fused with a target sequence for construction of a recombinant fusion construct which is a spressed in Caulobacter.                                                                                                                                                                                                                                                                                                                                                                              유
                                                                                                                                                                                                                                                                               ö
                                         This invention relates to a novel isolated peptide which comprises at least 1, 2, 3, 4, 5, 6 or 7 epitopes or analogues of the epitopes given in the specification. The peptide comprises HLA-A1, A2, A3, A24, B7 or B44 tumour associated antigen peptide. The invention may be useful for the production of compounds with a cytostatic activity or for the production of a vaccine. The peptide is useful in preparing a composition diagnosing or treating tumour associated antigen-related disease. The present sequence is that of an epitope peptide for use in the peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method of screening for and/or diagnosing breast cancer in a subject, and/or monitoring the effectiveness of breast cancer therapy. The method comprises detecting and/or quantifying in a biological sample obtained from the subject a breast cancer membrane protein (BCMP) polypeptide and a nucleic acid molecule. Also described: (1) an antibody, its functionally-active fragment, derivative or analogue, that specifically binds to one or more of the BCMP polypeptide; (2) a diagnostic kit comprising a capture of the BCMP polypeptide, reagents and instructions for use; (3) a method for screening for anti-breast cancer agents that interact with the BCMP polypeptide, comprising contacting the polypeptide agent interact with the polypeptide; (4) a method for screening for anti-breast cancer agents that modulate the expression or activity of an BCMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening, diagnosing and/or treating breast cancer by detecting a change in expression or activity of a breast cancer membrane protein (BCMP)
                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             breast cancer; screening; diagnosis; breast cancer therapy; breast cancer membrane protein; BCMP; cytostatic; vaccine; human.

(I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                 comparing the expression or activity of the polypeptide or nucleic acid molecule, in the presence and absence of a candidate agent or in the presence of a control agent, and determining whether the candidate agent causes the expression or activity of the polypeptide or nucleic acid molecule to change; and (5) an agent identified by the method of (3) or 4), which interacts with the polypeptide or causes the expression or activity of the polypeptide, or the expression of the nucleic acid molecule to change. BCMPs have cytostatic activities, and can be used in vaccines. The BCMP polypeptide, nucleic acid molecule, and can be used in their derivatives, are useful in the manufacture of a medicament for the treatment of breast cancer, where the composition is a vaccine. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A3.2 or A24.1 or HLA-B or C) and induce a cytocoxic T cell response against the antigen from which the peptide is derived. Cytocoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in antigen in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to the peptide e.g. to produce CTLB ex vivo for infusion back into a patient. The polynucleotides encoding the immunosenic peptides are also useful therapeutically and for immunisation as above
                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                           Immunogenic peptide having a human leukocyte antigen binding motif #1161.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.

The CTL recognise cells expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of

                                                                                                                                                                                                                                                                                                               This sequence represents an HLA-A24 antigenic peptide sequence used in the cytotoxic T-lymphocytes (CTL) of the invention. The CTL recognise cells expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of
                                                                                                                                                                                                                                                   Cytotoxic T-lymphocytes recognising cells expressing HLA-A24/antigenic peptide complex - and inducing agents for them consisting of such antigen

Cytotoxic T-lymphocytes recognising cells expressing HLA-A24/antigenic peptide complex - and inducing agents for them consisting of such antigen -presenting cells.
                                                                                                                                                                                        This sequence represents an HLA-A24 antigenic peptide sequence used in the cytotoxic T-lymphocytes (CTL) of the invention. The CTL recognise cells expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expressing HLA-A24/antigenic them consisting of such antigen

Cytotoxic T-lymphocytes recognising cells expressing HLA-A24/antigenic peptide complex - and inducing agents for them consisting of such antigen -presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents an HLA-A24 antigenic peptide sequence used in the cytotoxic T-lymphocytes (CTL) of the invention. The CTL recognise cells expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of
                                                                                                     HLA-A24; antigenic peptide; cytotoxic T-lymphocyte; CTL; HLA-A24 complex; cancer; therapy; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HLA-A24; antigenic peptide; cytotoxic T-lymphocyte; CTL; HLA-A24 complex;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an HLA-A24 antigenic peptide sequence used in the cytotoxic T-lymphocytes (CTL) of the invention. The CTL recognise calls expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of

This sequence represents an HLA-A24 antigenic peptide sequence used in the cytotoxic T-lymphocytes (CTL) of the invention. The CTL recognise cells expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an HLA-A24 antigenic peptide sequence used in the cytocoxic T-lymphocytes (CTL) of the invention.                                                                                                                                                                       Cytotoxic T-lymphocytes recognising cells expressing HLA-A24/antigenic peptide complex - and inducing agents for them consisting of such antigen -presenting cells.
                                                                                                                                                                                                                                                              This sequence represents an HLA-A24 antigenic peptide sequence used in the cytotoxic T-lymphocytes (CTL) of the invention. The CTL recognise cells expressing on their surface a complex of an HLA-A24 molecule with an antigenic peptide. The antigenic peptide is an HLA-A24 restrained antigenic peptide. The CTLs can be used in the treatment and diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytotoxic T-lymphocytes recognising cells expressing HLA-A24/antigenic peptide complex - and inducing agents for them consisting of such antigen -presenting cells.

The invention further relates to a novel non-human transgenic mammal transfected with an HLA-A24 gene in which cytotoxic T cells (CTL) are induced by HLA-A24-restricted antigenic stimulation. The invention further relates to a novel method of screening a remedy or a preventitive for a tumour or viral infection charaterised by comprising administering a test substance to the above-described non-human transgenic mammal and then assaying and evaluating whether or not CTLs specific to the test substance are induced therin. The invention also includes: a PSA-origin HLA-A24-restricted tumour antigen peptide selected by this screening method; a chimeric gene useful in forming the above-described transgenic con-human mammal, host cells transformed by this chimeric gene; and cutilisation thereof. The novel non-human transgenic mammal has cytostatic and virucide activity. This sequence represents a human HLA-A24 related peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                    Producing analogs of Major Histocompatibility Complex (MHC) class I peptidee pytiopes, for treating viral diseases or cancer, comprise producing an analog having (semi)conservative amino acid substitutions of the MHC class I epitope.
                                                                                                                                                                                                                                                                                                          The invention comprises a method for producing a polypeptide that contains an analogue of a major histocompatability complex (MHC) class I peptide epitope, wherein the analogue has enhanced immunogenicity compared to the MHC class I peptide epitope. The method of the invention is useful for producing an analogue or heteroclitic analogue of an MHC class I peptide epitope, and eliciting an immune responses. The method is useful for preparing MHC class I peptide epitope analogues that can be useful for treat viral diseases, cancer and other conditions characterized
                                                                                                                                                                                                                                                                                                                                                                                               by displayed antigens on target cells. The present amino acid sequence represents a peptide of the invention which is derived from human carcinoembryonic antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                major histocompatability complex class I epitope; MHC class I epitope; enhanced immunogenicity; heteroclitic analogue; immune response; viral disease; cancer; human; carcinoembryonic antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises a method for producing a polypeptide that contains an analogue of a major histocompatability complex (MHC) class I peptide epitope, wherein the analogue has enhanced immunogenicity compared to the MHC class I peptide epitope. The method of the invention is useful for producing an analogue or heteroclitic analogue of an MHC class I peptide epitope, and eliciting an immune response. The method is useful for preparing MHC class I peptide epitope analogues that can be used to treat viral diseases, cancer and other conditions characterized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    by displayed antigens on target cells. The present amino acid sequence represents a peptide of the invention which is derived from human

The present invention relates to antigenic peptides derived from tumour suppressor protein WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes. The peptides can be used in the preparation of cancer vaccine for treatment and prevention of cancer, including leukaemia, multiple myeloma, lymphoma, and cancer of the stomach, colon, breast, liver, ovary, skin, pancreas, prostate and womb. The present sequence is a polypeptide used in the exemplification of the invention
Antigenic peptides derived from WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes for production of cancer vaccine and treatment and prevention of cancer.

Novel Ii-Key/antigen presentation enhancing hybrid polypeptide, useful for treating infections, rheumatoid arthritis, multiple sclerosis, lupus erythematosus and diabetes mellitus.

Example 9; Page 34; 87pp; English.

polypeptide. The novel polypeptide has an N-terminal element consisting of 4-16 residues of a mammalian Ii-Key peptide and its non-N-terminal deletion modifications, a chemical structure covalently linking the N-terminal element to an MHC class presented epitope of a C-terminal element. The C-terminal element comprises an antigenic epitope, which binds to an antigenic peptide binding site of an MHC class II molecule. The invention relates to a novel antigen presentation enhancing hybrid

The antigen presentation enhancing hybrid polypeptide has the following activities: antibacterial, virucide, fundicide, antitheunatic, antitheunatic, antitheunatic, neuroprotective, dermachological, immunosuppressive, antiinflammatory, antidiabetic, and antithyroid. The antigen presentation enhancing hybrid polypeptide is useful for modulating the immune response in an individual and for treating infections (such as bacteria, virus, parasite and fungus), rheumatoid arthritis, multiple sclerosis, lupus erythematocous, diabetes mellitus, mysathenia gravis, aucoimmune thyroiditis, scleroderma, dermatomyostits and pemphigus. This sequence represents a mammalian Ii key related peptide epitope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a non-naturally occurring protein or polypeptide (I) modified by recombinant DNA techniques comprising: a C-terminal element comprising an MHC Class II-presented epitope; an N-terminal element comprising an II-key motif; and an intervening element comprising a sequence of 4-11 amino acid residues where the modification by recombinant DNA techniques taking place within elements (b) and (c). directed toward an MHC (major histocompatibility complex) Class II—
C directed toward an MHC (major histocompatibility complex) Class II—
C toward an MHC (lass II—presented epitope of interest comprises; providing a nucleic acid sequence encoding the MHC Class II—presented epitope of interest, the nucleic acid sequence encoding an II—Key motif located 4-II amino acids upstream from the N-terminal residue of the MHC Class II—
C presented epitope of interest, and modifying the II—Key motif located 4-II interest, and modifying the II—Key motif class II—
C interest comprises: providing a nucleic acid sequence encoding the MHC C lass II—Presented epitope of interest, the nucleic acid sequence lacking an II—Key motif located 4-II amino acids upstream from the N-terminal cresting of interest, the MHC Class II—presented epitope of interest, and modifying the N-terminal creating sequence to introduce an II—key motif appropriately content to polypeptide of interest corresponds to a protein or polypeptide of interest corresponds to a protein or polypeptide of interest corresponds to a protein or polypeptide (I) modified by recombinant DNA techniques is useful for treating infectious diseases caused or associated with infection by a content or polypeptide (I) modified by recombinant DNA techniques is useful for treating infectious diseases caused or associated with infection by a content or polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       bacterium, virus, paraaite, fungus, ricketteia or other infectious agents. It is also useful for treating rheumatoid arthritis, multiple sclerosis, lupus erythematogus, diabetes mellitus, myasthenia gravis, autoimmune thyroiditis, scleroderma, dermatomyositis, pemphigus, asthma, allergic rhinitis, topical dermatitis, colitis, cancer, psoriasis or adenomas. The present sequence represents the amino acid sequence of carcinoembryonic antigen (CBA) MHC class II-presented epitopeused in the
described are methods for: suppressing or enhancing an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAR67089-91 are sweet peptides derived from naturally occuring polypeptides that contain proline or proline/cysteine brackets. These peptides are shortened to form fragments that contain one or more tastered to farmeraction sites of interest. AAR67089-90 are deriv. from miraculin. The taste modifier peptides probably work through interaction with taste receptors modifying sour taste into sweet taste. Structural constraints, partic. cyclisation of the peptides, may help in the heat stability of these peptides in cooking. The data collected demonstrates that interaction paires possess activity when present in a polypeptide that differs from the native form. Inclusion of conformation-constraining moieties can have
                                            This invention relates to a novel isolated peptide which comprises at least 1, 2, 3, 4, 5, 6 or 7 epitopes or analogues of the epitopes given in the specification. The peptide comprises HIA-A1, A2, A3, A24, B7 or B44 tumour associated antigen peptide. The invention may be useful for the production of compounds with a cytostatic activity or for the production of a vaccine. The peptide is useful in preparing a composition diagnosing or treating tumour associated antigen-related disease. The present sequence is that of an epitope peptide for use in the peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide homologue or analogue with constrained conformation - has proline residues flanking the interaction site to impart greater, or more stable,

Also included are: (1) the nucleic acids encoding the HGPRBWYII proteins (including variants, fragments, complements and sequences 95% similar to the HGPRBWYII incleic acids); (2) recombinant vectors; (3) transformed host cells expressing HGPRBWYII; (4) an anti-HGPRBWYII antibody; (5) diagnosing a pathological condition or a susceptibility to a pathological condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polynucleotide sequences encoding a gene product
desirable effects on an interaction site. (Also see AAR67011-88 and AAR67092-152 for analogues of other biologically active peptides contg. an interaction site flanked by conformation constraining gps., eg. RGD peptides.) (Updated on 25-MRN-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 G-protein coupled receptor; cardiovascular disease; arrhythmia; myocardial infarction; congestive heart failure; cardiomyopathy; atherosclerosis; arteriosclerosis; embolism; angina; thrombosis; hypertension; Alzheimer's disease; Parkinson's disease; osteoporosis; obesity; human immunodeficiency virus infection; HIV; schizophrenia; sleeplessness; acquired immunodeficiency syndrome; AIDS; leukaemia; sepsis; inflammation; psoriasis; Gaucher's disease; ischaemia.

Novel peptides useful for activating neutrophils or blocking activation of neutrophils, modulating homotypic or heterotypic adhesion of CD66 polypeptides, and modulating immune cell activation. Claim 1; Page 39; 102pp; English.

The present sequence is an isolated peptide that was tested for its ability to modulate the function of CD66 family polypeptides and CD66 ligands. 106 sequences of 13 or 14 amino acids in length, and their analogues, were identified that modulate the function of at least one CD66 family polypeptide and/or at least one ligand of the polypeptide. The peptides are capable of modulating activation of neutrophils, activation or inhibition, prolliferation and/or differentiation of Testivation or inhibition, prolliferation and/or differentiation of Testivation or inhibition and/or differentiation of Ferentiation of System cells, prolliferation and/or differentiation of epithelial cells, homotypic and/or heterotypic adhesion among CD66 family polypeptides and adhesion of CD66 family polypeptides to other ligands. The peptides are useful for delivering a therapeutically active agent to a patient, for AABB 8018

The peptide modulates: (a) activation of neutrophils; (b) activation or inhibition of T-cells, B-cells, NK cells, dendritic cells or other immune system cells; (c) proliferation and/or differentiation of the above cells; (c) proliferation and/or differentiation of the above members on among CD66 family members; and (e) adhesion of CD66 family members; and (e) adhesion of CD66 family members and/or their ligands, such as activation of neutrophils and activation, inhibition, proliferation and/or differentiation of the immune cells. The peptides may also be used in treating or diagnosing autoimmune diseases, cancer, infections (e.g. bacterial or viral) or inflammatory diseases, in transplantation therapies and for immunisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide from a surface exposed region of a CD66 family member, useful for modulating the function of CD66 family members, e.g. activation of neutrophils, for treating or diagnosing autoimmune diseases or cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, CD66, CBACAM; cytostatic; antiinflammatory; immunomodulator;
antibacterial; virucide; gene therapy; vaccine; neutrophil;
immune system; autoimmune disease; cancer; infection; bacterial; virus;
inflammatory disease; transplantation; immunisation.

RESULT 38
            ABU1193
```

The invention relates to an isolated polypeptide (designated HGPRBMYII), which has a G-protein coupled receptor (GPCR) activity (also known as GPCRAL) and is encoded by the CDNA contained in ATCC Deposit Number PTA-2766, its variants (HGPRBMYI1v1 and HGPRBMYI1v2), fragments, domains, species homologues and proteins 95% similar to it. Also included care: (i) the nucleic acids encoding the HGPRBMYII proteins (including variants, fragments, complements and sequences 95% similar to the HGPRBMYII nucleic acids); (2) recombinant vectors; (3) transformed host calls expressing HGPRBMYII; (4) an anti-HGPRBMYII antibody; (5) diagnosing a pathological condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polymucleotide sequences encoding a gene product condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polymucleotide sequences encoding a gene product having altered GPCR activity; (9) a shuffled polymucleotide product condition, dor medulating activity; (9) a shuffled polymucleotide or the Dolymucleotide is useful for preventing, treating or ameliorating a medical condition, particularly cardiovascular diseases or disorders, cardiowypathy, atherosclerosis, arteriosclerosis, embolism, angine, thrombosis or hypertension). The HGPRBMYII polypeptide or polymucleotide is also useful for treating, preventing or ameliorating e.g. Alzheimer's diseases. Parkinnon's disease, osteoporosis, acteriosclerosis, embolism, and in immunodeficiency syndrome (AlDS), leukaemia, sepsis, acquired immunodeficiency syndrome (AlDS), leukaemia, sepsis, conflammations, portains, delegaes, osteoporosis, osteoporosis, accomposition or in the specification, congestive disease or ischemia (many other construction may be used as an immungen in the specification). The present construction of an HOPRBMYII protein (or variant) which may be used as an immungen

```
The invention relates to an isolated polypeptide (designated HGPRBMY11), which has a G-protein coupled receptor (GPCR) activity (also known as GPCR4 or GPCR81) and is encoded by the CDNA contained in ATCC Deposit Number PTA-2766, its variants (HGPRBMY1101 and HGPRBMY1102), fragments, comparins, species homologues and proteins 95% similar to it. Also included are: (1) the nucleic acids encoding the HGPRBMY11 proteins (including variants, fragments, complements and sequences 95% similar to the HGPRBMY11 mucleic acids); (2) recombinant vectors; (3) transformed host cells expressing HGPRBMY11; (4) an anti-HGPRBMY11 antibody; (5) diagnosing a pathological condition or a susceptibility to a pathological condition or a susceptibility to a pathological condition or a susceptibility to a pathological condition or a susceptibility or a pathological condition or a susceptibility or a pathological condition or a susceptibility or a pathological condition and activity; (9) a shuffled polynucleotide produced by the method of (9); and (10) servening for candidate compounds capable of binding to and/or modulating activity of a GPCR. The polypeptide or the polynucleotide is useful for preventing, treating or ameliorating a

(1) the nucleic acids encoding the HGPRBMY11 proteins (including

```
ö
medical condition, particularly cardiovascular diseases or disorders, e.g. myocardial infarction, congestive heart failure, arrhythmias, cardiomyopathy, atherosclerosis, arteriosclerosis, embolism, angina, thrombosis or hypertension). The HGPRBMY11 polypeptide or polymucleotide is also useful for treating, preventing or ameliorating e.g. Alzheimer's disease, Parkinson's disease, osteoporosis, obesity, human immunodeficiency virus (HIV) infections, schizophrenia, sleeplessness, acquired immunodeficiency syndrome (ALDS), leukkaemia, sepsis, inflammations, psoriasis, Gaucher's disease or ischaemia (many other diseases and discorders are listed in the specification). The present sequence represents a protein metif or domain of an HGPRBMY11 protein (or variant) which may be used as an immungen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polypeptide (designated HGPRBMIII), which has a G-protein coupled receptor (GPCR) activity (also known as PGCR74 or GPCRR), and is encoded by the cDNA contained in ATCC Deposit Number PTA-2766, its variants (HGPRBWIIV1 and HGPRBWYIIV2), fragments, domains, species homologues and proteins 95% similar to it. degenerate, fragments, complements and sequences 95% similar to the cells expressing HQPRBMY11 anti-body; (5) deprending national anti-hQPRBMY11 anti-body; (5) dagnosing a pathological condition or a susceptibility to a pathological condition or a susceptibility to a pathological condition or a subject; (6) identifying a binding partner to the condition in a subject; (7) identifying a binding partner to the condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polymoclecide sequences encoding a gene product to having altered GPCR activity; (9) a shuffled polymoclecitde produced by the method of (8); and (10) screening for candidate compounds capable of binding to and/or modulating activity of a GPCR. The polymeptide or the collymoclecities is useful for preventing, treating or ameliocating a cardiowascular diseases or disorders, cardiomyopathy, atherosolerosis, arteriosclerosis, embolism, angina, cthrombosis or hypertension). The HCPRBMY11 polypeptide or polymucleotide is also useful for treating, preventing or ameliorating e.g. Alzheimer's disease, parkinson's disease, osteoporosis, obesity, human immunodeficiency virus (HIV) infections, schizophrenia, sleeplessness, acquired immunodeficiency sporiasis, Gusease or ischaemia (many other cinflammations, psoriasis, Gaucher's disease or ischaemia (many other cinflammations, psoriasis, Gaucher's disease or ischaemia (many other capacity which may be used as an immungen of an HGPRBMY11 protein (or variant) which may be used as an immungen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Sequence 83, Application US/09231797

Patent No. 6084066

GENERAL INFORMATION:
APPLICANT: EVANS, Herbert J.
APPLICANT: EVANS, Herbert J.
APPLICANT: EVANS, Herbert J.
TITLE OF INVENTION: Polypeptides That Include Conformation-
TITLE OF INVENTION: Constraining Groups Which Flank A Proten-Protein Interaction S.
NUMBER OF SEQUENCES. 153
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
                                                                                                                                                                                                                               Sequence 83, Application US/08532818

GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: IDEX TECHNOLOGIES and
APPLICANT: ZIMMERNANN, Joseph
TITLE OF INVENTION: Systems For Heparinase II And Heparinase III Derived From
TITLE OF INVENTION: Flavobacterium heparinum
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hale and Dorr
STREET: 1455 Pennsylvania Avenue, N.W.
                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 60291, Application US/09270767
Patent No. 6703491
GENERAL INFORMATION
THORMATION SET APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REPERENCE: File Reference: 7326-094
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 60291
LENGTH: 23
                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

US-09-997-792A-19
; Sequence 19, Application US/0997792A
; Patent NO. 655521
; GENERAL INFORMATION:
; APPLICANT: ELI LILLY and COMPANY
; TILL OF INVENTION: Glucagon-Like Peptide-1 Crystals
; TILL OF INVENTION: Glucagon-Like Peptide-1 Crystals
; TILL OF INVENTION: CA10242A
; CURRENT APPLICATION NUMBER: US/09/997,792A
; CURRENT FILING DATE: 2002-09-30
; PRIOR APPLICATION NUMBER: US 60/069,728
; NUMBER OF SEQ ID NOS: 25
; SEQ ID NO 19
; LENGTH: 31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 22, Application US/09209799D

Patent No. 6380357

GENERAL INFORMATION

APPLICANT: Horfmann, James

APPLICANT: Hoffmann, James

APPLICANT: Narasinhan, Chakravarthy

TITLE OF INVENTION UNMER: US/09/209, 799D

CURRENT FILING DATE: 1998-12-11

NUMBER OF SEQ ID NOS: 29

SOFTWARER: Patentin version 3.0

LENGTH: 31

LENGTH: 31
ATTORNEY/AGENT INFORMATION:

NAME: BAKER, Hollie L.

REGISTRATION NUMBER: 31,321

REFERENCE/DOCKET NUMBER: 104385.116PCT

TELECOMMUNICATION INFORMATION:

TELEPHONE: (202)942-8484

INFORMATION FOR SEQ ID NO: 9:

SEQUENCE CHARACTERISTICS:

LENGTH: 23 amino acids

US-09-350-841A-1420
; Sequence 1420, Application US/09350841A
; Patent No. 6750008
; GENERAL INFORMATION:
; AFPILGANT: Jeffs, Peter;
; TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR INHIBITION OF MEMBRANE
; TITLE OF INVENTION: PUSION-ASSOCIATED EVENTS, INCLUDING HIV TRANSMISSION
; FILE REPRENCE: 7872-066-999
; CURRENT APPLICATION UMBER: US/09/350,841A
; CURRENT FILING DATE: 1999-07-09
; NUMBER OF SEQ ID NOS: 1946
; SOFTWARE: PATENTIN Ver. 2.1
; SEQ ID NO 1420
                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                            APPLICANT: Barney, S.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1419, Application US/09350841A

Patent No. 675008
GENERAL INFORMATION
TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR INHIBITION OF MEMBRANE
TITLE OF INVENTION: FUSION-ASSOCIATED EVENTS, INCLUDING HIV TRANSMISSION
FILLE REFERENCE: 7872-066-999
CURRENT APPLICATION NUMBER: US/09/350,841A
CURRENT PILLING DATE: 1999-07-09
NUMBER OF SEQ ID NOS: 1946
SOFTWARE: PatentIN Ver. 2.1
SEQ ID NO 1419
LENGTH: 39
                                                                                                                                                                                                                                                                                                         APPLICANT: Barney, S.

Sequence 312, Application US/10245871

Publication No. US20030235594A1

GENERAL INFORMATION:

APPLICANT: HUMPHREYS, ROBERT

APPLICANT: HUMPHREYS, ROBERT

TITLE OF INVENTION: I1-KEY/ANTIGENIC EPITOPE HYBRID PEPTIDE VACCINES

FILE REFERENCE: REH-2013

CURRENT APPLICATION NUMBER: 10/197,000

PRIOR FILING DATE: 2003-01-09

PRIOR PLICATION NUMBER: 10/197,000

PRIOR PLICATION NUMBER: 10/197,000

PRIOR PLILING DATE: 1999-09-14

NUMBER OF SEQ ID NOS: 905

SOFTWARE: Patentin Ver: 2.1

SEQ ID NO 312
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               OTHER INFORMATION: Description of Artificial Sequence: Synthetic OTHER INFORMATION: I1-key/MHC Class II/MHC Class I CEA hybrid OTHER INFORMATION: peptide
